Analog And Digital Communication Systems

Definition: Analog and digital communications are the two types of data transmission system however several factors generate the difference between the two. The major difference between analog and digital communication lies in the signal being transmitted. In analog communication, the message signal is in analog form i.e., continuous time signal.

Following are the sections of the digital communication system. Source. The source can be an analog signal. Example: A Sound signal. Input Transducer. This is a transducer which takes a physical input and converts it to an electrical signal (Example: microphone). This block also consists of an analog to digital converter where a digital signal is needed for further processes.

Digital signal. Digital signal is a non-continuous electrical signal, which is used to convey (send, receive, and process) information between the sender and receiver. In digital signal, the original information (analog information) is converted into a string of bits (digital information) before being transmitted.
