The Flory-Huggins equation represents one of the most important and most popular equations in the theory of polymer solutions. Highly concentrated polymer solutions, having a great practical importance, are a special class of solutions. Concentrated solutions are those in which the solute molecules mutually interact and thus the viscosity increases drastically. The formation of a true solution of plasticizer in polymer is possible if they are thermodynamically miscible.

Solution polymerization is a method of industrial polymerization. In this procedure, a monomer is dissolved in a non-reactive solvent that contains a catalyst or initiator. The reaction results in a polymer which is also soluble in the chosen solvent. Heat released by the reaction is absorbed by the solvent, and so the reaction rate is reduced.

Flow-induced fiber orientation is maintained during polymer cooling. Both shear and elongational flow will influence the orientation of fiber reinforcements. Processing variables such as fill rate, cavity thickness, melt viscosity, and gating scheme are all significant factors affecting fiber orientation.

4 Fundamentals of polymer chemistry Addition polymerisation of a different type takes place through the opening of a ring, especially the epoxide ring in ethylene oxide CH₂CH₂O. This opens as —CH₂CH₂O—; ethylene oxide thus acts as a bifunctional monomer forming a polymer as H—CH₂CH₂O—n—CH₂CH₂O—H, in this case a terminal water molecule being added.

Fundamentals Of Polymer Processing 0th Edition Textbook ...

In this process, a chelating agent is used, most often citric acid, to surround aqueous cations and sterically entrap them. Subsequently, a polymer network is formed to immobilize the chelated cations in a gel or resin. This is most often achieved by poly-esterification using ethylene glycol. The resulting polymer is then combusted under oxidising conditions to remove organic content and yield a product oxide with homogeneously dispersed cations.

The rheology of polymer solutions is important in several stages of the manufacturing and processing of polymers, such as in the spinning of fibers and the casting of films from solutions, and especially in the paints and coatings industry. The rheology of a polymer solution increases with the polymer concentration.
